Visual Studio: NU1008 Central Package Management problem Mar 21, 2025 · The build system thinks that your solution has Central Package Management (CPM) enabled while your package references are not configured to support said setup. If you did not change anything in your setup, something must be setting `ManagePackageVersionsCentrally` configuration property to `True` for you outside of your project files. The most probable culprit is ... [c++ - const string vs. #define - Stack Overflow](#)

The preprocessor should only be used for include guards, `__FILE__` and similar built-in macros, and `#ifdefs` for platform-specific constants. While you can use it for defining constants actually used by your code, it is a bad idea for several reasons which have been pointed out in the answers below. [c++ - 'static const' vs. '#define' - Stack Overflow](#) Oct 28, 2009 · Is it better to use static const variables than `#define` preprocessor? Or does it maybe depend on the context? What are advantages/disadvantages for each method? [c++ - Why use #define instead of a variable - Stack Overflow](#) May 14, 2011 · What is the point of `#define` in C++? I've only seen examples where it's used in place of a "magic number" but I don't see the point in just giving that value to a variable instead. **Is it possible to use a if statement inside #define?** There are multiple problems with your macro: it expands to a statement, so you cannot use it as an expression the arguments are not properly parenthesized in the expansion: invoking this macro with anything but variable names or constants will produce problems. the arguments are evaluated multiple times: if you invoke the macro with arguments that have side effects, such ... [How to specify multiple return types using type-hints](#) Jul 3, 2024 · I have a function in python that can either return a bool or a list. Is there a way to specify the return types using type hints? For example, is this the correct way to do it? `def foo (id) -> li...` **Why are #ifndef and #define used in C++ header files?** I have been seeing code like this usually in the start of header files: `#ifndef HEADERFILE_H #define HEADERFILE_H` And at the end of the file is `#endif` What is the purpose of this? **Is there a way to do a #define inside of another #define?** You could for example do an `ifdef` guard to initialize a variable in a macro but make sure it isn't declared twice. I'm sure there are other possible use cases. Besides, it's normal to give simplified examples when asking theoretical questions. Pointing out there's a different way is kind of pointless for this kind of question. **How do I define a function with optional arguments?** How do I define a function with optional arguments? Asked 13 years, 5 months ago Modified 1 year, 1 month ago Viewed 1.2m times [How do I show the value of a #define at compile-time?](#) I know that this is a long time after the original query, but this may still be useful. This can be done in GCC using the

stringify operator "#", but it requires two additional stages to be defined first. #define XSTR(x) STR(x) #define STR(x) #x
The value of a macro can then be displayed with: #pragma message "The value of ABC: " XSTR(ABC) See: 3.4 Stringification
