This can be done in GCC using the stringify operator "#", but it requires two additional stages to be defined first. #define XSTR(x) STR(x) #define STR(x) #x The value of a macro can then be displayed with: #pragma message "The value of ABC: " XSTR(ABC) See: 3.4 Stringification in the gcc online ... **How do I define a function with optional arguments?** How do I define a function with optional arguments? A good way to understand what the preprocessor does to your code is to get hold of the preprocessed output and look at it. *Is there a way to do a #define inside of another #define?* You could for example do an ifdef guard to initialize a variable in a macro but make sure it isn't declared twice. I'm sure there are other possible use cases. Besides, it's normal to give simplified examples when asking theoretical questions. Pointing out there's a different way is kind of pointless for this kind of question. What is the purpose of the #define directive in C++? May 10, 2010 · 0 in C or C++ #define allows you to create preprocessor Macros. In the normal C or C++ build process the first thing that happens is that the PreProcessor runs, the preprocessor looks through the source files for preprocessor directives like #define or #include and then performs simple operations with them. c++ - Why use #define instead of a variable - Stack Overflow May 14, 2011 · What is the point of #define in C++?
